In the recently published Ref. 1 the author survey a number of aspects of the geometry of digital spaces. In this article we exemplify the approach of that book, by providing a self-contained proof of one of its final result which is to do with the correctness and the characterization of the output of a general purpose boundary-tracking algorithm.

Digital geometry deals with discrete sets (usually discrete point sets) considered to be digitized models or images of objects of the 2D or 3D Euclidean space.. Simply put, digitizing is replacing an object by a discrete set of its points. The images we see on the TV screen, the raster display of a computer, or in newspapers are in fact digital images.. Its main application areas are computer ...

A digital manifold is a special kind of combinatorial manifold which is defined in digital space i.e. grid cell space. A digital form of the Gauss–Bonnet theorem is: Let M be a closed digital 2D manifold in direct adjacency (i.e., a $(6,26)$ -surface in 3D). The formula for genus is $\{\displaystyle g=1+(M_{\{5\}}+2M_{\{6\}}-M_{\{3\}})/8\}$,

In the paper, we consider geodesic mappings of spaces with an affine connections onto generalized symmetric and Ricci-symmetric spaces. In particular, we studied in detail geodesic mappings of spaces with an affine connections onto 2-, 3-, and m- (Ricci-) symmetric spaces. These spaces play an important role in the General Theory of Relativity.

In digital geometry and topology, there are two popular kinds of digital spaces: point spaces and raster spaces. In point-spaces, a digital object is presented by a set of elements. In raster spaces as defined in this note, a digital object is a subset of a 'relation' on the space. In an Euclidean space, given a set S of points which are called sites, we can get the Voronoi diagram of S and its Delaunay triangulation.

This paper is devoted to establishing the most refined axiom for a digital covering space which remains open. The crucial step in making our approach is to simplify the notions of several types of earlier versions of local (k_0, k_1) -isomorphisms and use the most simplified local (k_0, k_1) -isomorphism. This approach is indeed a key step to make the axioms for a digital covering space very refined.
