Nodal analysis can be a model of a gas or an oil well. It can simulate a single well's performance including such components flow as the flowline, a surface or downhole choke, tubing performance, completion effects such as perforations, and inflow performance

NODAL analysis is a standard technique in production engineering to integrate the entire producing system from reservoir to facilities. The total production system consists of reservoir, near well bore, the well, tubular, artificial lift, gathering lines and manifolds.

A comprehensive set of inflow models complement the multiphase flow capabilities in PROSPER, enabling Nodal Analysis calculations to be done for virtually any type of well. There are over 20 inflow models that have been developed over the years, that can be applied to horizontal, vertical, deviated, multilayer and multilateral geometries.

Systems provides a modern view on the use of nodal analysis techniques to optimize the production from oil and gas wells. It covers multiphase flow through flow lines, wells, chokes and the near-well reservoir. It teaches the development of mathematical models for those system elements, and how to implement these in computer code.
